**Opus Healthcare Solutions Provides Texas Hospital District With Advanced Clinical Information System on ASP Basis**

**AUSTIN, Texas, March 25, 2008 /PRNewswire/** -- Opus Healthcare Solutions will install its *OpusClinicalSuite*® information system into the Lynn County Hospital District on an ASP (Application Service Provider) basis. This will enable the rural hospital district to obtain the latest clinical information system without a major upfront cost in new hardware and support staff.

The *OpusClinicalSuite*® provides a single point-of-access for clinicians to retrieve all patient clinical information (patient vitals, lab results, medications, imaging results), from the bedside or remote locations such as their office or distant clinics. The suite enables hospitals to meet patient safety issues and implement quality measures for improved patient outcomes.

The Lynn County Hospital District, which includes a critical access hospital (CAH), serves three rural counties near Lubbock, Texas.

Jim Morris, the Chief Executive Officer of the district, said, "We had been seeking to upgrade our clinical information system for a long time, but were concerned about the purchase and maintenance of a lot of expensive new hardware. Obtaining the *OpusClinicalSuite*® on an ASP basis is the best of both worlds. We get access to one of the most advanced clinical information systems available on a subscription basis and Opus will house and maintain it."

According to Morris, a portion of the cost of the system is expected to be reimbursed on the hospital's annual Medicare cost report which should help make this project even more affordable to the hospital district.

Fred Beck, President of Opus Healthcare Solutions, said, "Many rural hospitals find it difficult to attract and retain skilled IT professionals. When we provide our software on an ASP basis, we assume responsibility for installing and updating it, easing the work load on existing staff."

**About Opus Healthcare Solutions, Inc.**

Based in Austin, TX Opus Healthcare Solutions, Inc. delivers highly adaptable, truly Web-based clinical applications to hospital systems and integrated health networks. The 2<sup>nd</sup> generation technology of the *OpusClinicalSuite*® includes secure Smartphone access to patient records via cellular and WiFi networks, clinical documentation, order management, medication administration checking and charting, a clinical data repository, a patient dashboard, physician Web access, and laboratory data management inclusive of microbiology and anatomic pathology. The system is built on a secure Web architecture, and capable of sharing clinical data through an integrated HL7/XML interface engine.

More than 10,000 clinicians across the U.S. now use software solutions provided by Opus Healthcare Solutions.
